

Volunteer:

I assumed that volunteers are assigned to events as events of one campaign can happen on the same day, so they cannot be assigned to the campaign as it would be impossible to work two events happening at the same time. I made the tiers for Volunteer an attribute as making it an ISA relation seemed pointless as I assumed that there are no different attributes between the tiers. So now a volunteer can easily get there tier from the attribute.

Event:

I assumed that an event is only part of one campaign. I also assumed that two events will not be happening at the day in the same location. This means that I can identify each event by its location, date, and campaignID, so I made this the key and event is a weak entity.

Office:

I know that GNG only has one office at the moment, but I gave office its own entity set just in case GNG wants to expand and get more offices.

Website Posting:

For a website posting I assumed that a web posting must be about one campaign. I also assumed that there could be many postings about a single campaign, but that these postings would not be posted at the exact same time, therefore a website posting can have the campaignID, date, and time as the key, and be made a weak entity.

Fund:

Each entity in the entity set funds will be a transaction that occurs involving GnG, therefore there needs to be a

fundID, amount, date, and time. I assumed that amount could either be a positive or negative number.
